Technical and Bibliographic Notes / Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming are checked below.

- Coloured covers / Couverture de couleur
- Covers damaged / Couverture endommagée
- Covers restored and/or laminated / Couverture restaurée et/ou pelliculée
- Cover title missing / Le titre de couverture manque
- Coloured maps / Cartes géographiques en couleur
- Coloured ink (i.e. other than blue or black) / Encre de couleur (i.e. autre que bleue ou noire)
- Coloured plates and/or illustrations / Planches et/ou illustrations en couleur
- Bound with other material / Relié avec d'autres documents
- Only edition available / Seule édition disponible
- Tight binding may cause shadows or distortion along interior margin / La reliure serrée peut causer de l'ombre ou de la distorsion le long de la marge intérieure.
- Blank leaves added during restorations may appear within the text. Whenever possible, these have been omitted from filming / Il se peut que certaines pages blanches ajoutées lors d'une restauration apparaissent dans le texte, mais, lorsque cela était possible, ces pages n'ont pas été filmées.
- Additional comments / Commentaires supplémentaires:

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- Coloured pages / Pages de couleur
- Pages damaged / Pages endommagées
- Pages restored and/or laminated / Pages restaurées et/ou pelliculées
- Pages discoloured, stained or foxed / Pages décolorées, tachetées ou piquées
- Pages detached / Pages détachées
- Showthrough / Transparence
- Quality of print varies / Qualité inégale de l'impression
- Includes supplementary material / Comprend du matériel supplémentaire
- Pages wholly or partially obscured by errata slips, tissues, etc., have been refilmed to ensure the best possible image / Les pages totalement ou partiellement obscurcies par un feuillet d'errata, une pelure, etc., ont été filmées à nouveau de façon à obtenir la meilleure image possible.
- Opposing pages with varying colouration or discolourations are filmed twice to ensure the best possible image / Les pages s'opposant ayant des colorations variables ou des décolorations sont filmées deux fois afin d'obtenir la meilleure image possible.

This item is filmed at the reduction ratio checked below /
Ce document est filmé au taux de réduction indiqué ci-dessous.

The copy filmed here has been reproduced thanks to the generosity of:

National Library of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shell contains the symbol \rightarrow (meaning "CONTINUED"), or the symbol ∇ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Bibliothèque nationale du Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole \rightarrow signifie "À SUIVRE", le symbole ∇ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

LETTER OF TRANSMITTAL.

FORESTY BRANCH,
DEPARTMENT OF THE INTERIOR,
OTTAWA, NOVEMBER 6, 1915.

SIR: I beg to transmit herewith a report on the manufacture of Lumber Lath and Shingles for calendar year 1914 and to recommend its publication as Bulletin No. 56 of this Branch.

The report is similar to those published in previous years, giving an account of the quantity of wood manufactured into lumber in the Dominion and the various provinces for the year specified, the total value, and the average value per thousand feet, board measure, with the proportion of the total product manufactured in each province. Each kind of wood is similarly considered by itself. Tables are also given showing the quantity and value, by provinces, of each kind of wood manufactured into lumber during the year. There is also given a directory of the manufacturers of these products throughout the Dominion, which includes the names of all those manufacturers of the products specified who furnished this Branch with information as to their production during the year reported on.

Respectfully submitted,

R. H. CAMPBELL,
Director of Forestry.

W. W. CORY, Esq., C.M.G.,
Deputy Minister of the Interior,
Ottawa

Lumber Production in Canada, 1914.....	To face p. 10
--	---------------

LUMBER, LATH AND SHINGLES.

This bulletin gives the statistics of the production of lumber, lath and shingles by mills in Canada during the calendar year 1914. The statistics are gathered almost entirely by correspondence which in the past has been carried on by the Forestry Branch of the Department of the Interior with the mill operators. An arrangement was entered into with Mr. G. C. Piché, M. F. Chief of the Forest Service of the province of Quebec for the collection of these statistics in Quebec province for 1914. As Mr. Piché's staff are in close touch with the lumbermen in Quebec the returns for 1914 are exceptionally complete and are not therefore exactly comparable with those of former years, the number of reports received being almost double that of 1913. A similar arrangement with Mr. H. R. MacMillan, M. F., Chief Forester of the British Columbia Forest Service has resulted similarly in more complete statistics for that province, twenty-three more mills contributing to the reports than in 1913. It is hoped that co-operative arrangements of this nature will be made with the other lumber-producing provinces in the future.

Including returns from Quebec and British Columbia, as indicated above, 2,843 firms or individuals operating saw- and shingle-mills in Canada furnished the figures on which this bulletin is compiled. This is a total increase of 656 mills due largely as before explained, to more complete returns from Quebec and British Columbia.

The total production for 1914 includes, 3,946,254,000 feet board measure of sawn lumber valued at \$60,363,369; 625,010,000 lath valued at \$1,585,484; 1,843,554,000 shingles valued at \$3,688,746; making a total value for the three classes of products of \$65,637,599.

(A directory of active saw- and shingle-mills in Canada in 1914 will be found in the appendix).

NOTE: The following figures are as nearly correct for the production of all the provinces as it is possible to make them. It should be noted that most of the provinces saw into lumber logs cut in an adjoining province. Logs cut in Quebec are sawn in Ontario and New Brunswick, logs cut in Ontario are sawn in Quebec and Manitoba, and the same crossing of the boundary occurs in the other western provinces. While this does not greatly affect the total credited to each province, an endeavour will be made to eliminate in future issues, the slight difference thus caused.

LUMBER.

Table A is a summary of the information concerning the production of sawn lumber classed by provinces.

The average prices given are prices at the mill for sawn material. The average for the whole of Canada shows a decrease of only \$1.94 which is a remarkably small decrease in view of existing conditions. The price fell in the three most important lumber-producing provinces, Quebec, Ontario and British Columbia, and also in Saskatchewan. In the remaining five provinces including the three Maritime Provinces a slight increase is to be noted.

*Less than one-tenth of 1 per cent.

†Decrease from 1913 to 1914

The production in 1914 includes lumber cut from at least fifty different tree species. In the reports received from the saw-mill operators and on the market generally the lumber cut from these different trees is grouped wherever its properties are of a similar nature. The twenty-seven kinds of lumber in Table B are the result of such a grouping. There is only one species each of Douglas fir, beech, basswood and butternut cut in Canada, but there are at least five spruces, four balsam firs, and four birches. In some instances these

are further separated into smaller groups or single species but the practice is not universal and it is not, therefore, possible in every case to make the separation from the reports received. Wherever practicable this separation has been carried out in the individual tables given later.

A decrease of 24.1 per cent in the cut of Douglas fir has caused this wood to fall from second to third place on the list. The greater completeness of the reports from Quebec, where balsam fir is an abundant species, has brought this wood up from tenth to fifth place on the list. The cut of spruce increased by over 13 per cent and formed in 1914, 36.5 per cent of the lumber cut in Canada. Other increases among the more important woods are to be noted in the cases of hemlock, balsam fir, cedar, jack pine, basswood and poplar; and decreases in white pine, Douglas fir, red pine, birch, tamarack, maple, yellow pine and elm. Among the fifteen most important woods cut in Canada the greatest increase in production was in balsam fir and the greatest decrease in western yellow pine.

The average mill price of lumber produced in 1914 decreased by \$1.94 per thousand feet. Out of the total twenty-seven kinds reported only five increased in price from 1913 to 1914. These were balsam fir, maple, chestnut, cherry and tulip. In every other case the mill price decreased.

SOFTWOODS vs. HARDWOODS.

Table C shows the relative production by provinces, of softwood, or the wood of evergreen or coniferous trees, and hardwood, or wood of the deciduous-leaved trees.

Jack Pine	41,000	1.1	Butternut	1,711	*
Yellow Pine	31,616	0.9	Chestnut	1,163	*
Yellow Cypress	19	*	†All others	1,522	*

*Less than one-tenth of 1 per cent.

†Includes Hickory, Cherry, Walnut, Tulip, Black Gum and Red Alder.

Canada's lumber-producing trees are largely softwoods and lumber of this description formed 93.2 per cent of the total, practically the same proportion as in 1913. In the production of this class of lumber Quebec leads and the order of the other provinces on the list is the same as in Table A, with the exception that British Columbia ranks second and Ontario third. British Columbia cuts more softwood than Ontario although its total production of lumber is less. In Quebec, the Maritime Provinces and the Prairie Provinces the most important softwood is spruce. In Ontario white pine has always headed the list and in British Columbia, Douglas fir.

Ontario is the most important hardwood-producing province, cutting over twice as much as Quebec which comes second on the list. The other provinces in order of their importance as producers of hardwood are as follows: Nova Scotia, New Brunswick, British Columbia, Prince Edward Island, Manitoba, Alberta and Saskatchewan. In Quebec and the three Maritime Provinces birch is the most important hardwood. In Ontario maple heads the list and in the three Prairie Provinces aspen poplar. Cottonwood poplar is the most important deciduous-leaved tree in British Columbia.

The relative importance of the different provinces as producers of lumber in general, the comparative production of hardwoods and softwoods and the importance of the more abundant woods in each case are all shown graphically in the large inserted diagram facing page 10. The area of each square or part of a square represents the production of lumber in each case. In some cases the quantities to be represented are so small in comparison that when reduced to the scale of the diagram, they occupy less space than the width of the lines.

LUMBER PRODUCTION BY PROVINCES.

Tables I to IX inclusive give the details of lumber production by kinds of wood in the nine provinces of Canada.

*Less than one-tenth of 1 per cent.

The average mill production in Quebec in 1914 was only 851,000 feet due to the large number of small mills running only part of the year cutting lumber for farmers in their immediate vicinity.

Spruce in the above table includes white spruce (*Picea canadensis*), red spruce (*Picea rubra*) and black spruce (*Picea mariana*) in order of importance as to quantity of lumber produced.

The balsam fir (*Abies balsamea*), white pine (*Pinus Strobus*), hemlock (*Tsuga canadensis*), red pine (*Pinus resinosa*), basswood (*Tilia americana*), cedar (*Thuja occidentalis*), tamarack (*Larix laricina*), aspen poplar (*Populus tremuloides*), butternut (*Juglans cinerea*), cherry (*Prunus serotina*), beech (*Fagus grandifolia*), chestnut (*Castanea dentata*) and walnut (*Juglans nigra*) are in each case the product of the single species of which the botanical name is given.

Birch lumber in Quebec is the product of the yellow birch (*Betula lutea*) and the paper birch (*Betula alba* var. *papyrifera*) with, perhaps, small quantities of cherry birch (*Betula lenta*) and white birch (*Betula populifolia*).

The jack pine (often erroneously called "cypress") is the wood of one species (*Pinus Banksiana*) with perhaps some lumber cut from the pitch pine (*Pinus rigida*).

"Hard" maple is cut from one tree only (*Acer saccharinum*), "soft" maple lumber may be cut either from silver maple (*Acer saccharinum*) or red maple (*Acer drumbii*).

The ash is divided into two classes. The harder wood being that of the American ash (*Fraxinus americana*) and the softer material, black ash (*Fraxinus nigra*). There are three elms in Quebec of commercial importance, white elm (*Ulmus americana*), rock elm (*Ulmus racemosa*) and red or slipper elm (*Ulmus fida*).

Poplar in Quebec apart from aspen poplar may be either balm poplar (*Populus balsamifera*), large-toothed aspen (*Populus grandidentata*) or common cottonwood (*Populus deltoides*). In the reports received the aspen is usually the only one separated from the other poplars.

Red oak (*Quercus rubra*) is the most important oak species in Quebec in point of quantity of lumber produced, although the wood of the white oak (*Quercus alba*) is more valuable. There are other oak species of only minor importance.

There are four hickories that contribute to the supply of hickory lumber but the wood of these is so closely related that they are seldom separated in the market.

Ontario's 718 saw-mills cut on an average 1,451,000 feet of lumber in 1914. The small custom mills and portable mills are not so abundant here as in Quebec.

The different species which go to make up the twenty different kinds of wood listed in the table above are similar to those already described for Quebec with the exception of red spruce which is rare in this province and with the addition of tulip (also called "yellow poplar" and "whitewood") which is the lumber of the tulip tree (*Liriodendron tulipifera*) and black gum or "pepperidge" (*Nyssa sylvatica*) both of which in Canada are confined, with a few other unimportant species, to a narrow strip of territory along the north shore of lake Erie.

*Less than one-tenth of 1 per cent.

British Columbia, with only 172 mills and an output of almost a billion feet of lumber, has an average annual mill production of 5,145,000 feet board measure.

Douglas fir, the most important single species of lumber-producing tree in Canada, is known botanically as *Pseudotsuga mucronata*.

The cedar in this province is a different species from that of the eastern provinces. This is called western red cedar, or sometimes giant cedar (*Thuja plicata*).

The greater part of the spruce lumber sawn in British Columbia is cut from Engelmann spruce (*Picea Engelmanni*) and Sitka spruce (*Picea sitchensis*).

The black spruce of the East is fairly common in northern British Columbia and the eastern white spruce is also found in the province, and the lumber cut from these two species may form a part of the total given above.

The tamarack of the province is usually called western larch (*Larix occidentalis*) and is a distinct Pacific Coast species. Mountain larch (*Larix Lyallii*), the Rocky Mountain species, is of little or no commercial importance. The British Columbia yellow pine is the wood of one species often called bull pine

TABLE V.

*Less than one-tenth of 1 per cent.

Portable mills and small custom or neighbourhood mills in Nova Scotia produce a fairly large proportion of the total cut of lumber and bring the average mill production down to about 810,000 feet a year.

Red spruce (*Picea rubra*) here forms by far the greater part of the spruce lumber. Black spruce is fairly common but white spruce is comparatively rare.

Red oak and bur oak are the only oak species cut commercially, otherwise the species are similar to those in New Brunswick and Quebec.

TABLE VI.

SASKATCHEWAN LUMBER, 1913 AND 1914, BY KINDS OF WOOD.

Kind of Wood	No. of Active Mills Reporting.	Quantity.		Per Cent Distribution.	Total Value.	Average Value Per M Ft. B.M.	
		1913.	1914.		1914.	1913.	1914.

The so-called "spruce mills" in the Prairie Provinces are as a rule mills of fairly large capacity. In Saskatchewan 17 mills had an average annual production of 3,331,000 feet, coming second to British Columbia only in this respect.

The spruce is probably 90 per cent or more white spruce, with the remainder black spruce. The red species is not found west of eastern Ontario.

The tamarack is all of the single eastern species (*Larix laricina*), the jack pine is *Pinus Banksiana* as in Ontario and the aspen poplar is also the same as that cut in Eastern Canada.

TABLE VII.

In Alberta in 1914 the average mill produced 962,000 feet of lumber.

In this province toward the Rocky Mountains changes are noticed in the species. In addition to white and black spruce Engelmann spruce, similar to that of British Columbia, is cut on the East Slope. Lodgepole pine (*Pinus Murrayana*) comes down the slope and mixes with the eastern jack pine. Two typically western cottonwoods (*Populus angustifolia* and *Populus lanceolata*) are found in river bottoms in southern Alberta. Douglas fir and alpine larch reach their eastern limit of distribution on the East Slope.

TABLE VIII.

*Less than one-tenth of 1 per cent.

The saw-mills in Manitoba reported cutting 1,116,000 feet each, on an average, in 1914.

The lumber produced in this province is largely similar to that of Saskatchewan, although many of the trees typical of Ontario and Quebec are cut in small quantities in southeastern Manitoba. The cottonwood may be either the common cottonwood (*Populus deltoides*) of the East or the two comparatively rare western trees, lanceleaf cottonwood (*Populus lanceolata*) and narrowleaf cottonwood (*Populus angustifolia*). The elm is all white or American elm (*Ulmus americana*). The only oak cut in commercial quantities is the bur oak (*Quercus macrocarpa*). The birch is all paper birch (*Betula alba* var. *papyrifera*).

*Less than one-tenth of 1 per cent

The smallest mill production was reported in 1914 from Prince Edward Island where 62 mills each cut, on an average, 110,000 feet board measure.

The tree species that go to make up the lumber produced in the three Maritime Provinces are practically identical. In Prince Edward Island red spruce predominates, paper birch and yellow birch alone of the birches are cut in quantity. Tamarack is often erroneously called "juniper" and the only oaks found are the red and bur oaks. Otherwise the species are the same as those described for New Brunswick and Nova Scotia.

LUMBER PRODUCTION BY KINDS OF WOOD.

Tables 1 to 18 show the details of the production of lumber by kinds of wood in the different provinces of Canada in 1913-14.

Under "Commercial species included" are given the accepted common name and the botanical name (in italic) of each species that goes to make up the total. Rare and commercially unimportant species are not mentioned. Following the botanical name is a list of abbreviations representing the provinces in which that particular species is cut; where the abbreviation is enclosed in brackets, the species rarely occurs, or is of little commercial importance in the province.

SPRUCE.

Commercial species included:—

White spruce (*Picea canadensis*)—All provinces.

Red spruce (*Picea rubra*)—P.E.I., N.S., N.B., Que., (Ont.).

Black spruce (*Picea mariana*)—All provinces.

Engelmann spruce (*Picea Englemanni*)—B.C., Alta.

Sitka spruce (*Picea sitchensis*)—B.C.

*Less than one-tenth of 1 per cent

Spruce lumber in general is light, soft, stiff, moderately strong and tough. It is non-resinous, odourless and tasteless and has a fine, even, straight grain. It is slightly less durable than pine but seasons well, holds its shape, is not easily split in nailing and is comparatively easy to work.

White spruce has, probably, the coarsest grain and lightest colour of the five Canadian species.

Red spruce has a finer grain and texture, a distinct reddish tinge and a satiny lustre. It may be slightly stronger and more durable than white spruce.

Black spruce being a swamp tree is usually of slow growth with narrow rings. It is consequently, stronger, harder and more durable than the preceding species.

Sitka spruce, found in the Coast region of British Columbia, is the largest of the Canadian spruces and produces the finest quality of clear lumber of large dimensions. Its wood is probably the softest, lightest in weight and darkest in colour of the five species. It is pale brown with a distinct red tint.

Engelmann spruce is a smaller tree but produces an equally high proportion of clear lumber. Its wood is light, soft and straight-grained with a fine texture and a light yellowish colour. It is cut in the mountain mills of British Columbia and sold as mountain spruce.

WHITE PINE.

Commercial species included: --

White pine (*Pinus Strobus*)-- P.E.I., N.S., N.B., Que., Ont., (Man.)

Western white pine (*Pinus monticola*)-- B.C.

TABLE 2.

*Less than one-tenth of 1 per cent.

White pine lumber is light and soft; and weak, except in relation to its weight. Its grain is fine, even and straight and the wood is moderately resinous. It seasons easily and rapidly and is more durable than spruce. It contracts and expands to such a small extent through changes in humidity that few woods exceed it in the quality of holding its place. As it is easy to work, holds nails well, and takes paint well, it has always been a prime favourite with wood-workers.

The wood of the western white pine is a little heavier than that of the eastern. It is slightly stiffer and, while its strength in general is a little lower it is usually considered to be more durable than the eastern species. Otherwise the properties of the two woods are very similar.

DOUGLAS FIR.

Commercial species included:—

Douglas fir (*Pseudotsuga mucronata*)—B.C. (Alta).

TABLE 3.

DOUGLAS FIR LUMBER, 1913 AND 1914, BY PROVINCES.

Province.	No. of Active Mills Reporting.	Quantity.		Per Cent Distribution.	Total Value.	Average Value Per M Ft. B.M.

Alberta	1	291	231	*	3,350	13.65	11.50

*Less than one-tenth of 1 per cent.

The lumber of Douglas fir is strong, hard, tough, elastic, straight-grained and durable. When seasoned, it is hard, difficult to work and easily split. While more important at present as a structural timber because of its strength and the dimensions in which it can be secured, it is becoming very popular for decorative purposes, selected cuts showing an attractive grain and figure.

HEMLOCK.

Commercial species included:—

Eastern hemlock (*Tsuga canadensis*)—P.E.I., N.S., N.B., Que., Ont.
Western hemlock (*Tsuga heterophylla*)—B.C.

TABLE 4.

HEMLOCK LUMBER, 1913 AND 1914, BY PROVINCES.

Prince Edward Island	23	265	465	0.1	5,562	14 59	11 96

Hemlock is a hard, stiff wood, which holds nails well and is non-resinous. The wood of the eastern species is brittle, cross-grained, harsh and splintery with a fine grain but a coarse texture. It is more durable than spruce but less so than than white pine. The lumber is difficult to season, warping and checking in the process. It has a high percentage of defect due to knots and cup shakes. Trees growing on well-drained upland produce a better quality of lumber often called "white hemlock." Its strength combined with its cheapness and abundance are its most valuable characteristics.

The western species has few of the objectionable qualities of its eastern relative. Its lumber is light, rather hard, straight-grained, tasteless, tough and, usually, white in colour. Its structure is more uniform, the summer-wood instead of being corky, stands up well under a cutting edge and the lumber is easily worked and gives a smoother surface than the eastern wood. Cup shakes and warping are exceptional. The durability and strength of the wood are not remarkable but because of ease of working, a handsome grain and finish and lightness the wood has considerable value. Edge grain western hemlock makes an excellent flooring material.

BALSAM FIR.

Commercial species included:—

Balsam fir (*Abies balsamea*)—All provinces but B.C.

Mountain fir (*Abies lasiocarpa*)—B.C., Alta.

Amabilis fir (*Abies amabilis*)—B.C. (Coast region).

Lowland fir (*Abies grandis*)—B.C. (Coast region).

TABLE 5.

BALSAM FIR LUMBER, 1913 AND 1914, BY PROVINCES.

Prince Edward Island	41	2,030	2,007	0.8	27,919	11 44	13 91

The wood of all the firs is very similar, being light in weight, soft, not strong, brittle and even-grained. The lumber is fairly easy to season but is not so durable as most other coniferous woods.

CEDAR.

Commercial species included:—

White cedar (*Thuja occidentalis*)—P.E.I., N.S., N.B., Que., Ont., (Man.).

Western red cedar (*Thuja plicata*)—B.C.

TABLE 6.

Prince Edward Island	3	1	43	*	635	20 00	14 77
Manitoba		1				18 00	

*Less than one-tenth of 1 per cent.

The eastern white cedar is noted chiefly for its extreme durability in moist situations. It probably exceeds all other native coniferous woods in this respect. It is soft and weak but possesses a remarkably straight, fine grain and fine, even texture. It seasons easily and rapidly without damage. The wood splits evenly and easily, owing to its straight grain, and is easy to work. Like white pine it holds its place with very little "working."

The western red cedar is lighter, softer, weaker, and more spongy in texture. It can, however, be obtained in larger clear dimensions and is much more abundant than the eastern lumber.

RED PINE.

Commercial species included:—

Red or Norway pine (*Pinus resinosa*)—P.E.I., N.S., N.B., Que., Ont., (Man.).

TABLE 7.

RED PINE LUMBER, 1913 AND 1914, BY PROVINCES.

Prince Edward Island	3	66	24	.	680	30 00	28 33

*Less than one-tenth of 1 per cent.

Red pine is a harder, stronger, more elastic wood than white pine and is more resinous and probably more durable. It is more difficult to work than white pine and is therefore used largely for heavy structural framework.

BIRCH.

Commercial species included:—

Yellow birch (*Betula lutea*)—P.E.I., N.S., N.B., Que., Ont.

Sweet birch (*Betula lenta*)—N.S., N.B., Que., Ont.

Paper birch (*Betula alba* var. *papyrifera*)—All provinces.

Western birch (*Betula occidentalis*)—B.C.

*Less than one-tenth of 1 per cent.

There are eight different species of birch native to Canada which reach tree size but only the four mentioned above are of commercial importance as lumber producers.

The wood of the first two mentioned, which is usually called hard birch, is strong, compact, heavy and hard. Its grain is fine and its texture fine and even. The lumber is difficult to season and liable to shrink and check. Being hard and compact it takes a high polish, the sweet birch possessing a natural satiny lustre. The wood is easy to work but is not durable in moist situations. The yellow birch is lighter in weight and colour and less lustrous than the sweet birch but is far more abundant in Canada.

The lumber cut from the paper birch is inferior to that of the "hard" birches for most purposes but is much more abundant. The wood is light in weight and colour, fairly strong and hard and very tough. In whiteness and toughness it exceeds the "hard" birches. It is however weaker and less durable in contact with moisture. It is valuable wood for turnery because of its compactness and the fact that it holds its shape when seasoned. It is fairly hard but does not dull lathe tools as quickly as many other woods.

The western birch which is the largest of the native birches produces the greatest proportion of large dimension lumber free from defects. Its wood is very similar to that of paper birch.

TAMARACK.

Commercial species included:—

Tamarack (*Larix laricina*)—All provinces.

Western larch (*Larix occidentalis*)—B.C.

TABLE 9.

TAMARACK LUMBER, 1913 AND 1914, BY PROVINCES.

*Less than one-tenth of 1 per cent.

The wood of tamarack or larch is very similar to that of the southern hard pines and to Douglas fir, being hard, strong and heavy. It is also very durable, tough, and elastic. The eastern species is a typical swamp tree of slow growth and narrow rings and, consequently, produces heavy, dense wood. The western species, in dryer situations, grows more rapidly and produces a lumber which is softer and easier to work. This lumber finishes with a higher lustre and is more durable than that of the eastern tree.

MAPLE.

Commercial species included:—

- Sugar maple (*Acer saccharum*)—P.E.I., N.S., N.B., Que., Ont.
- Silver maple (*Acer saccharinum*)—P.E.I., N.S., N.B., Que., Ont.
- Red maple (*Acer rubrum*)—P.E.I., N.S., N.B., Que., Ont.
- Broad-leaved maple (*Acer macrophyllum*)—B.C.

TABLE 10.

MAPLE LUMBER, 1913 AND 1914, BY PROVINCES.

British Columbia	3	26	54	0 1	2,101	10 77	38 91

The lumber cut from the sugar maple is usually sold as "hard" maple. The wood is hard and stiff, and these are its most valuable qualities. It is difficult to season, as it checks and warps, but if properly seasoned it holds its shape well. It is not durable in moist situations and the wood is said to be liable to failure under a sudden shock, although its strength under a steady strain is very high.

The wood of the red and silver maples is sold as "soft" maple and while softer and more friable than that of the hard maple it is usually tougher and lighter in weight. The wood of the western species is similar to eastern soft maple.

JACK PINE.

Commercial species included:—

Jack pine (*Pinus Banksiana*)—All provinces east of B.C.

Lodgepole pine (*Pinus Murrayana*)—Alta., B.C.

TABLE 11.

JACK PINE LUMBER, 1913 AND 1914, BY PROVINCES.

Prince Edward Island	1	6	2	*	40	12.50	20.00

*Less than one-tenth of 1 per cent

Compared to the other pine species of Canada the wood of jack pine is soft, light, weak and brittle and has little to recommend it but its cheapness and abundance. Defective material due to knots is very common. The wood, however, is used to advantage for rough construction where it prevents the unnecessary use of more valuable lumber.

BASSWOOD.

Commercial species included:—

Basswood (*Tilia americana*)—P.E.I., N.S., N.B., Que., Ont.

TABLE 12.

BASSWOOD LUMBER, 1913 AND 1914, BY PROVINCES.

Province	No. of Active Mills Reporting	Quantity		Per Cent Distribution.	Total Value.	Average Value Per M. Ft. B.M.	
		1913	1914			1913	1914
		M. Ft. B.M.	M. Ft. B.M.	1914	\$	\$ cts	\$ cts

Nova Scotia	2		45	0.1	750		16.67
New Brunswick	2	21	6	*	120	16.43	20.00

*Less than one-tenth of 1 per cent

This is one of the softest, lightest and weakest of the so-called "hard-woods." It is usually considered to be fairly tough. With a fine, even, texture though fairly coarse grain, the wood is exceedingly easy to work. It seasons easily and rapidly, and does not warp or split. Although the wood is not durable in wet places, there are few woods that hold their place better than this. It takes paint well and can be stained to imitate more valuable cabinet woods.

YELLOW PINE.

Commercial species included:

Western yellow, or bull pine (*Pinus ponderosa*)—B.C.

TABLE 13.

YELLOW PINE LUMBER, 1913 AND 1914, BY PROVINCES.

Province	No. of Active Mills Report- ing	Quantity.		Per Cent Distri- bution	Total Value	Average Value Per M. T. C. B. M.	
		1913	1914			1913	1914
		M. T. C. B. M.	M. T. C. B. M.		\$	\$ cts.	\$ cts.
Total, All Provinces	39	58,939	31,616	100 0	463,525	11 83	13 39
British Columbia	39	58,939	31,616	100 0	463,525	11 83	13 39

The wood of the western yellow or "bull" pine is structurally similar to the red pine of the east although its sapwood resembles white pine in its properties. The wood is usually stronger, harder and more resinous than white pine but less so than red pine.

ELM.

Commercial species included:—

White elm (*Ulmus americana*)—P.E.I., N.S., N.B., Que., Ont. (Man., Sask.).

Rock elm (*Ulmus racemosa*)—Que., Ont.

Red elm (*Ulmus fulva*)—Que., Ont.

TABLE 14.

ELM LUMBER, 1913 AND 1914, BY PROVINCES.

Prince Edward Island	2	4	4	*	75	20 00	18 75

*Less than one-tenth of 1 per cent.

Rock elm is the hardest, heaviest, toughest, strongest and most durable of the three species cut in Canada. Its wood is almost as valuable as hickory for some purposes on account of these qualities. American, or white, elm is the most abundant of the three in Canada. Its wood is below the average for weight and is not excessively strong nor hard. It is, however, one of the toughest hardwoods in Canada. It has a coarse grain but fine texture and is not very durable and is difficult to season, due to warping and twisting.

The wood of the red elm is not sawn into lumber in any great quantity. It is sold as soft elm and is soft, coarse-grained, and weak; separating along the annual rings into cup shakes.

POPLAR.

Commercial species included:—

Aspen (*Populus tremuloides*)—All provinces.

Balsam poplar (*Populus balsamifera*)—All provinces.

Cottonwood (*Populus deltoides et al. sp.*)—Que., Ont., (Man., Sask., Alta.).

Cottonwood, Black (*Populus trichocarpa*)—B.C.

TABLE 15.

The wood of aspen is light in weight, almost white in colour, soft and not strong, but in stiffness and toughness it exceeds many heavier hardwoods. It is very perishable and difficult to season.

The balsam poplar and the cottonwoods are closely related and are usually considered to be more valuable as lumber than aspen, exceeding it in strength. The cottonwoods are the most valuable of all the poplars on account of their lightness, softness, straight grain and the ease with which they can be worked. The wood resembles basswood in many respects but is softer and tougher, and, because of its interlaced fibrous structure, resists friction to a remarkable degree, considering its softness.

BEECH.

Commercial species included:—

Beech (*Fagus grandifolia*)—P.E.I., N.S., N.B., Que., Ont.

TABLE 16.

The wood of the American beech is very hard and moderately stiff, tough, strong and heavy. The lumber sawn from old trees is usually straight-grained, but that of young trees is often cross-grained. It splits easily but is difficult to season without warping, twisting, checking and shrinking. It is not a durable wood but if properly seasoned holds its place fairly well. The surface takes a high polish and wears well under friction. Many manufacturers claim that the use of beech would increase if the saw-mills were more careful in separating the light, almost white sapwood from the darker, red heartwood. The so-called "red-beech" is the dark heartwood from trees growing in deep, well-drained soil.

ASH.

Commercial species included:-

White ash (*Fraxinus americana*) - All provinces east of Manitoba.

Black Ash (*Fraxinus nigra*) - P.E.I., N.S., N.B., Que., Ont. (Man.)

TABLE 17.

White ash is probably the toughest, most elastic wood in Canada. It is also moderately hard and strong. Unlike elm it is fairly easy to season and holds its shape better when seasoned. Black ash is softer, weaker and less desirable for structural work, but is much easier to work and, possessing a pleasing grain and figure, is more valuable for decorative cabinet work.

OAK.

Commercial species included:—

White oak (*Quercus alba*)—Que., Ont.

Red oak (*Quercus rubra*)—P.E.I., N.S., N.B., Que., Ont.

Black oak (*Quercus velutina*)—Ont.

Bur oak (*Quercus macrocarpa*)—N.S., N.B., Que., Ont., Man.

There are some twelve species of oak reaching tree size in Canada but only white and red oak are sawn in commercial quantities. The wood of the oaks in general is heavy, hard, strong and tough. The characteristic grain and figure, especially on quartered lumber, are popular at the present time for decorative cabinet work and the demand for the wood exceeds that of any other similar hardwood. The value of the wood for vehicle stock, boat framing and similar purposes, depending on its technical properties rather than its appearance, has been known and appreciated for centuries.

The white oak is considered to be the most valuable for strength, appearance and durability. The white oak group includes the bur oak, while the red and black species belong to the less valuable group the members of which are, generally speaking, less strong, hard, tough and durable.

Red Alder	1	6	90	15.00				6

MINOR SPECIES.

The nine woods listed in Table 19 are cut in small quantities in Canada and are in most cases confined to restricted regions. The butternut (*Juglans cinerea*) is a wood of similar appearance to black walnut (*Juglans nigra*) but lighter in colour, weaker, softer and less durable. Chestnut (*Castanea dentata*) is one of the softest of the so-called hardwoods but, unlike bass-wood and poplar, it has a pronounced grain and figure. It holds its place remarkably well and is extremely durable in all situations. There are four species of hickory cut commercially in Canada the wood product of which is so similar that it is seldom separated. With a few minor exceptions the wood of the hickories is the hardest, heaviest, strongest and toughest of American woods. It is now very scarce in Canada owing to its great demand in the vehicle and handle industries.

Black cherry (*Prunus serotina*) is one of the most valuable of the comparatively rare cabinet woods of Canada. Its technical value, apart from its beauty and rarity, is high. The wood is dense, strong, even-grained and possesses excellent wearing and "standing" qualities. Tulip, whitewood or yellow poplar (*Liriodendron tulipifera*) is probably the softest, lightest, weakest wood in Canada. It is valued for its ease of working and permanency of shape.

Yellow cypress (*Chamaecyparis nootkatensis*), often called Alaska cypress or cedar, is neither a cedar nor a cypress but resembles these in many respects. It is harder than the cedars as a rule and is light, stiff and strong with a pronounced figure. It is easily worked, "stands" well and is very durable. Black gum or "pepperidge" (*Nyssa sylvatica*) is moderately strong and stiff, fairly hard and very difficult to split, making it valuable for certain parts in vehicle work.

Red alder (*Alnus oregona*) is a relative of the eastern alders which reaches tree size on the Pacific coast and is set on into lumber which is reddish brown in colour, compact and hard, with a fine even grain. It works easily takes a good polish and can be used to imitate more valuable cabinet woods.

LATH.

The production of lath bears a close relation to the production of sawn lumber. In almost every case lath is produced as a by-product from what would otherwise be waste material in a saw-mill. The relative importance of the different provinces producing lath depends on their lumber production and the extent to which this particular kind of close utilization is carried on. The demand for lath is greater in Ontario than in Quebec greater in New Brunswick and Nova Scotia than in British Columbia.

The production of lath according to kinds of wood follows the production of lumber more closely although the hardwoods are seldom sawn into lath; never to the same extent as the softwoods.

*Less than one-tenth of 1 per cent.

The western red cedar is the most important shingle wood in Canada and it naturally follows that British Columbia produces the greatest number of shingles. Although shingles are often produced as a by-product in saw-mills, this use of wood is more exacting than in the case of lath, and the material is more carefully chosen. Cedar is durable, easily worked and holds nails well; and many mills exist, especially in British Columbia, where cedar shingles are the only product.

The order of importance of the different woods used in shingle manufacture depends primarily on their suitability for this purpose while in the case of lath the supply of available waste material and the market regulate the use of different woods.

APPENDIX.

DIRECTORY OF SAW-MILLS IN CANADA.

NOTE. The manufacturers whose names appear in this list are those from whom replies have been received for this bulletin as to their lumber production for the year 1914. No attempt has been made to separate mills not operating during the year from those in actual operation. Names prefixed by an asterisk (*) are those of firms that manufactured 20,000,000 feet, board measure, or more, of lumber in 1914.
